PFAS Declaration of Conformity

General

Per- and polyfluoroalkyl substances (PFAS) are commonly known as "the forever chemicals" because they do not degrade in the natural environment. Their water- and soil-repellent properties make these substances a widely used product. However, there are growing concerns about the potential risks to the environment and the impacts on humans and animals.

As a further step toward a universal PFAS restriction, the EU Commission has restricted the use of unecafluorohexanoic acid (PFHxA) and PFHxA-related substances, a subgroup of PFAS chemicals. These pose an unacceptable risk to health and the environment. Alternatives are available, and transition periods of between 18 months and 5 years are planned.

Declaration

Based on our current knowledge and information from our suppliers, we confirm that our standard products do not contain per- and polyfluoroalkyl substances.

These are only included in the circuit boards if the customer orders PTFE-containing base materials (Teflon) for their products.
